CYBER SECURITY: PROTECTING USERS FROM ONLINE THREATS

Protecting people from fake links and online scams

Presented by

Mahalakshmi S

THE PROBLEM

Fake messages and links trick people into losing their money

Problem statement

Phishing means fake messages that look like they come from a bank or a trusted company. People cannot tell a fake link from a real one in a few seconds, so they share their password or OTP (one-time password) and lose money. Most of it is never recovered.

How a scam happens

1. An urgent fake message arrives
2. The link opens a fake page asking for your OTP
3. The scammer takes the money in minutes

₹19,813 Cr

lost by people in India to online fraud in 2025

21.77 lakh

complaints filed about online cheating in 2025

₹814 Cr

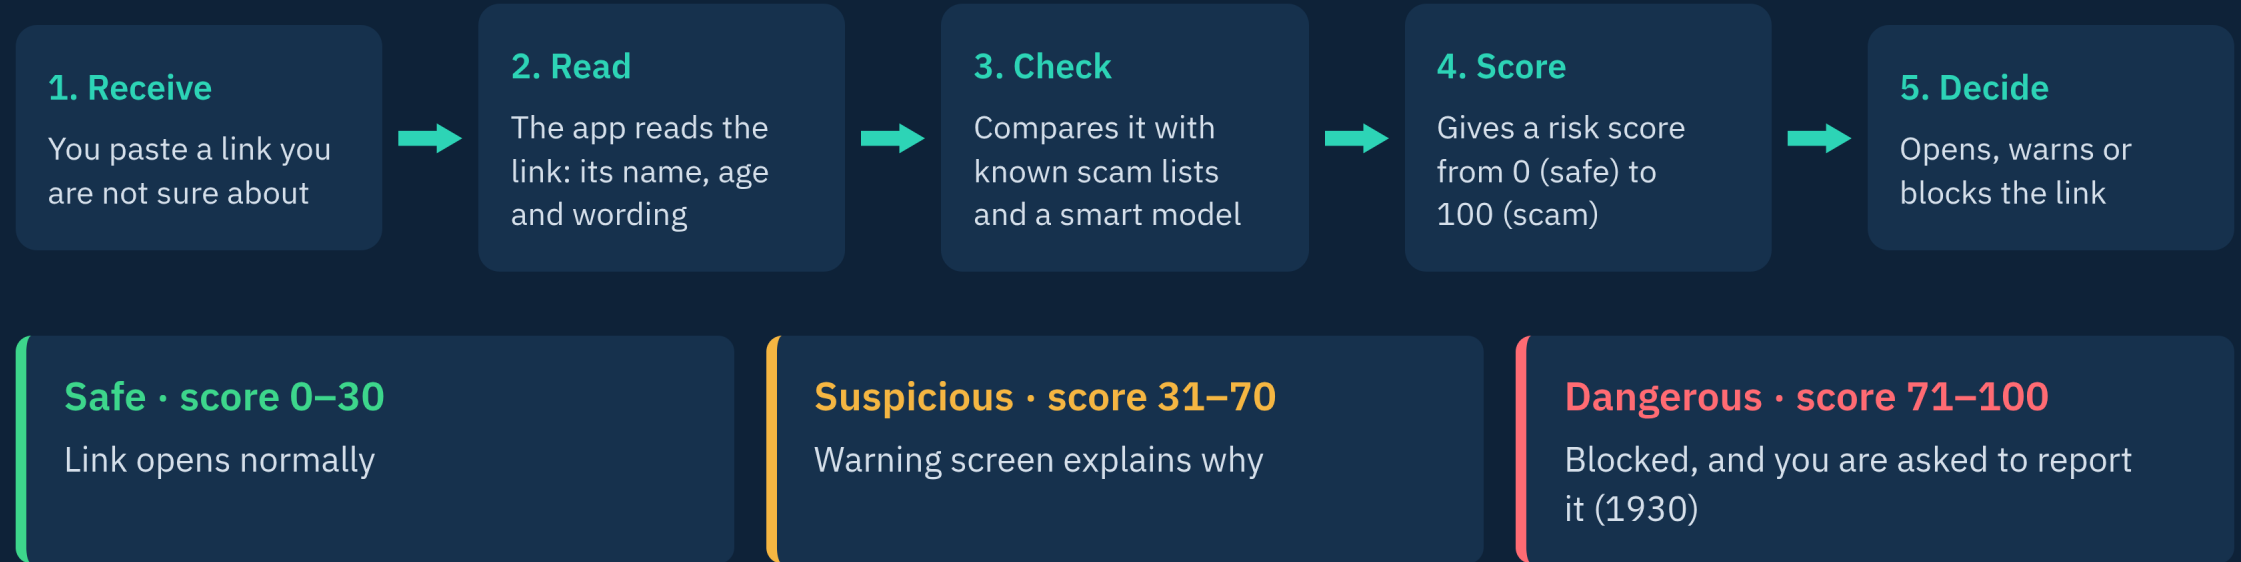

lost in Kerala in 42,504 cases in 2025

60%

of data breaches involve a person's action, like clicking a fake link

THE SOLUTION

PhishGuard: checks a link and warns you before you click

THE PROTOTYPE

Prototype: paste a link and see if it is safe

PhishGuard URL Checker

`http://bank-kyc-update.example-login.xyz/verify`

DANGEROUS · Risk 92 / 100 · Link blocked

- The website is only a few days old
- It copies the look and words of a bank
- It asks for OTP and card details on an unsafe page

Sample output (illustrative)

What it does

- Reads the link and looks for warning signs
- Checks known scam lists and a smart model
- Explains the risk in plain words
- Shows how to report the fraud

Tech stack

[Replace with your tools, e.g. Python, scikit-learn, Flask]

Thank You

Think before you click. Three habits keep you safe:

Pause

Do not rush when a message feels urgent

Verify

Check the sender and the link before you open it

Report

Call 1930 or use the National Cyber Crime Reporting Portal
